README – AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

1. Project Overview

Auto Ticket Classification using Flow Designer is a ServiceNow no-code automation project for a school IT helpdesk. The project addresses the repetitive manual activity of reviewing newly created IT support requests and selecting an appropriate Category and Subcategory.

The solution uses Flow Designer to evaluate keywords in the Short Description of a newly created Incident Workflow record. Based on the matching issue type, the flow updates Category and Subcategory and then sends a confirmation email to the caller.

2. Problem Addressed

The school IT helpdesk receives requests such as Wi-Fi problems, projector failures, password or login issues, and slow or hanging computers. Manual classification requires IT staff to inspect each request and select the appropriate values, which increases repetitive work and can produce inconsistent ticket information.

3. Solution

- Create an Incident Workflow table containing the required ticket fields.
- Configure Category, Subcategory and State choices.
- Make Subcategory dependent on Category.
- Create the Auto Classify School IT Tickets flow.
- Trigger the flow when a record is created and Category is empty.
- Use keyword-based If / Else If conditions.
- Update Category and Subcategory automatically.
- Send an email notification to the caller.

4. Classification Rules

- WiFi / Network → Network / Wi-Fi
- Projector → Hardware / Projector
- Password / Login → Access / Forgot Password
- Slow / Hanging → Performance / Slow Computer

5. Main Project Objects

- Incident Workflow table
- Category and Subcategory dependent choice configuration
- Flow: Auto Classify School IT Tickets
- Project Update Set

6. Project Folder Structure

The documentation package is organized into eight phases: Brainstorming & Ideation, Requirement Analysis, Project Design, Project Planning, Project Development, Project Testing, Project Documentation, and Project Demonstration.

7. Basic Flow

Record Created → Category Empty → Keyword Analysis → Update Record → Send Email.

8. Testing

The documented project testing includes a WiFi scenario and a Projector scenario. The WiFi test uses the description 'WiFi not working in library' and verifies Network / WiFi. The Projector test uses 'Projector not turning on' and verifies Hardware / Projector. The project material also identifies Password/Login and Slow/Hanging branches that should be executed and evidenced in the target ServiceNow instance.

9. Deployment

The configuration is maintained through a Project Update Set. After validation, the update set can be moved from In progress to Complete and exported to XML for transfer to another environment, following the documented deployment procedure.

10. Expected Benefits

- Reduces repetitive manual ticket classification.
- Improves consistency of Category and Subcategory values.
- Provides automatic caller acknowledgement.
- Supports easier maintenance through Flow Designer.
- Provides a foundation for future extensions such as additional rules and automation.

11. Demonstration

For demonstration, create an Incident Workflow record, enter a caller and a test Short Description, save the record, verify the resulting Category and Subcategory, inspect the email notification, and show the active flow in Flow Designer.

12. Documentation Note

This README is prepared from the project material supplied for Auto Ticket Classification using Flow Designer. It preserves the project's terminology and documented workflow rather than introducing unrelated ServiceNow features.
