ProjectName	Auto Ticket Classification using Flow Designer
Maximum Marks	3 Marks

REQUIREMENT ANALYSIS

1. Project Requirement Overview

The school IT helpdesk receives support requests from students and teachers for common issues such as network connectivity, hardware failures, account access problems, and system performance issues. The project requires a ServiceNow solution that reduces the manual work involved in reviewing and classifying these tickets.

2. Business Requirements

- Automatically classify IT tickets based on the issue description.
- Assign both Category and Subcategory without manual intervention.
- Support dependent choice logic between Category and Subcategory.
- Send an automated email notification to the caller upon ticket creation.
- Store ticket information in a structured and standardized format.
- Ensure easy maintenance and future scalability.

3. Functional Requirements

The solution must provide a custom Incident Workflow table for storing ticket records. It must contain the fields required to identify the caller, describe the issue, classify the incident, track its state, and associate the ticket with appropriate users or groups.

- Create a Project Update Set in the Global application and keep it current during development.
- Create the Incident Workflow table and enable Auto Number.
- Configure Category, Subcategory and State as choice fields.
- Configure Subcategory to depend on Category.
- Create the Flow Designer automation named Auto Classify School IT Tickets.
- Trigger the flow when a record is created and Category is empty.
- Update Category and Subcategory according to Short Description keywords.
- Send an email confirmation to the caller after classification.

REQUIREMENTS – DATA, AUTOMATION AND VALIDATION

4. Data and Field Requirements

Field Label	Type	Reference / Choice
Number	Auto Number	—
Caller	Reference	sys_user
Category	Choice	Network, Hardware, Access, Performance
Subcategory	Choice	Wi-Fi, Projector, Forgot Password, Slow Computer
Short Description	String	Issue summary
Description	String	Issue details
State	Choice	New, In progress, On hold, Resolved, Closed
Assigned Group	Reference	sys_user_group
Assigned to	Reference	sys_user

5. Category–Subcategory Dependency

- Network → Wi-Fi
- Hardware → Projector
- Access → Forgot Password
- Performance → Slow Computer

6. Flow Designer Automation Requirements

The flow must analyze the Short Description and use If / Else If conditions to classify the ticket. The documented classification rules are:

- WiFi or Network → Category: Network; Subcategory: Wi-Fi.
- Projector → Category: Hardware; Subcategory: Projector.
- Password or Login → Category: Access; Subcategory: Forgot Password.
- Slow or Hanging → Category: Performance; Subcategory: Slow Computer.

7. Email Notification Requirement

After classification, the flow must use the Send Email action. The recipient is Caller → Email, the subject is “Your Request for the issue has been submitted,” and the body contains the ticket confirmation message.

8. Testing and Validation Requirements

- Mandatory fields must be captured correctly.
- Auto-number must be generated without duplication.
- Category and Subcategory values must be stored accurately.
- Reference fields must resolve correctly to the user and group tables.
- WiFi and Projector scenarios must produce the documented classifications and email notification.

9. Expected Requirement Outcome

The completed system should provide consistent automatic ticket classification, reduce manual effort, improve ticket-routing efficiency, maintain structured ticket data, and provide immediate acknowledgement to the caller. The solution should remain no-code, maintainable, and scalable for future enhancement.
