USE CASE DIAGRAM

USE CASE DIAGRAM – AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

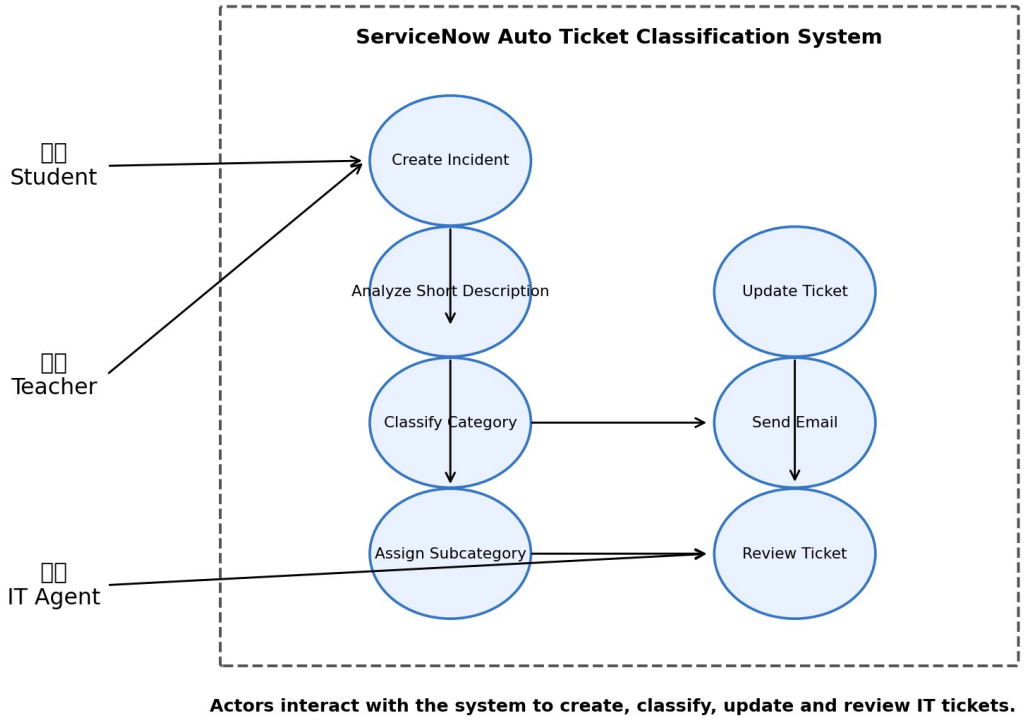

Figure 2: Use Case Diagram for Auto Ticket Classification using Flow Designer

The use case diagram shows the interaction between Students, Teachers and IT Agents and the ServiceNow Auto Ticket Classification system. Users create incident requests, while the system analyzes the description, classifies the issue, assigns the appropriate Subcategory, updates the ticket and sends an email notification. IT Agents can review the resulting ticket.

1. Actors

Students and Teachers act as callers who submit IT support requests. The IT Agent represents the support-side user who reviews and handles classified tickets. The system performs classification and notification automatically.

2. Main Use Cases

• Create Incident – Enter caller and issue information.

• Analyze Short Description – Flow Designer evaluates predefined keywords.

• Classify Category – Select Network, Hardware, Access or Performance.

• Assign Subcategory – Select the corresponding Wi-Fi, Projector, Forgot Password or Slow Computer option.

• Update Ticket – Store the classification in the Incident Workflow record.

• Send Email – Notify the caller after ticket creation/classification.

• Review Ticket – IT support staff review the structured ticket for further handling.

3. Mechanism of Working

The caller creates an incident. Flow Designer is triggered when the record is created and Category is empty. The flow checks the Short Description through If/Else If conditions, updates Category and Subcategory, stores the result and sends the configured email notification. This provides an automated path from user request to support review.
