ProjectName	Auto Ticket Classification using Flow Designer
Maximum Marks	3 Marks

DEVELOPMENT GUIDE
FLOW LOGIC – AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Mechanism: Create record → check Category → evaluate Short Description → update record → notify caller

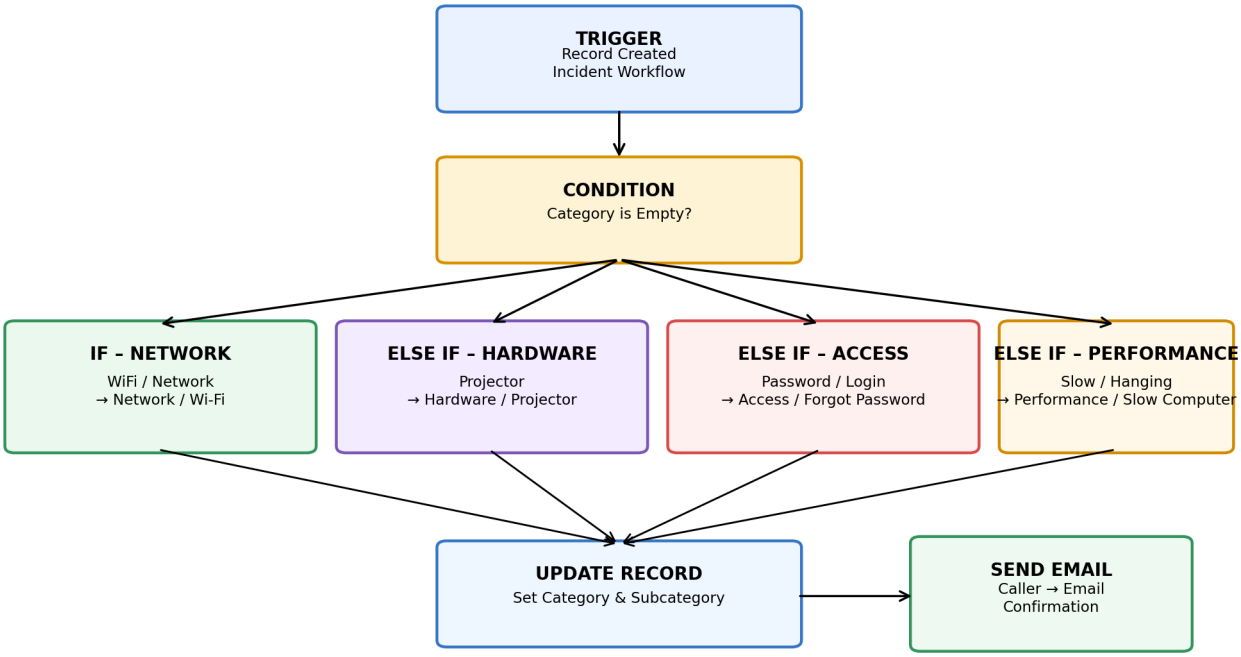

Figure 7: Flow Logic for Auto Ticket Classification using Flow Designer

The flow logic represents the development mechanism of the project. A newly created Incident Workflow record activates the flow when Category is empty. Flow Designer evaluates the Short Description using keyword conditions and updates Category and Subcategory according to the matching issue type. The final action sends an email notification to the caller.

1. Configure the Update Set

Create a Project Update Set under System Update Sets → Local Update Sets. Set its state to In progress, use the Global application as required, save it and make it the current update set. This provides a package for the project configuration.

2. Create the Incident Workflow Table

Open System Definition → Tables and create the Incident Workflow table. Enable Auto Number under Controls. The project uses fields including Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned to.

3. Configure Choices and Dependency

Configure Category values for Network, Hardware, Access and Performance. Configure the corresponding Subcategory values and make Subcategory dependent on Category. The documented mappings are Wi-Fi under Network, Projector under Hardware, Forgot Password under Access, and Slow Computer under Performance.

4. Create the Flow

Create the flow named Auto Classify School IT Tickets. Use Record Created as the trigger on the Incident Workflow table and add the condition Category is Empty. This ensures that the classification logic operates when a new record requires classification.

5. Configure Keyword Conditions

Use If / Else If branches to evaluate the Short Description. For WiFi or Network terms, set Network and Wi-Fi. For Projector, set Hardware and Projector. For Password or Login, set Access and Forgot Password. For Slow or Hanging, set Performance and Slow Computer.

6. Update the Record and Send Email

Use Update Record actions to write the Category and Subcategory values to the incident. After classification, configure Send Email with the recipient Caller → Email and the project notification subject. Activate the flow after configuration and validation.

7. Development Mechanism

The complete development mechanism is: create the table and fields → configure dependent choices → create the Record Created trigger → check Category is Empty → evaluate keywords → update Category and Subcategory → send caller notification. This provides a no-code workflow for consistent ticket classification.
