TeamID	6ab4e4596603573ccfb5b460
ProjectName	Auto Ticket Classification using Flow Designer
Maximum Marks	3 Marks

DEMONSTRATION STEPS

1. Demonstration Objective

The demonstration shows the complete Auto Ticket Classification using Flow Designer process, beginning with the creation of an IT incident and ending with automatic classification and caller notification. The demonstration should show the configured flow and the documented WiFi and Projector test scenarios.

2. Step 1 – Open the ServiceNow Project

Open the ServiceNow environment and navigate to the project configuration. Confirm that the Incident Workflow table and the Auto Classify School IT Tickets flow are available.

3. Step 2 – Show Flow Designer

Open Flow Designer and display the Auto Classify School IT Tickets flow. Show the Record Created trigger, the Category is Empty condition, the keyword decision branches, the Update Record actions and the Send Email action.

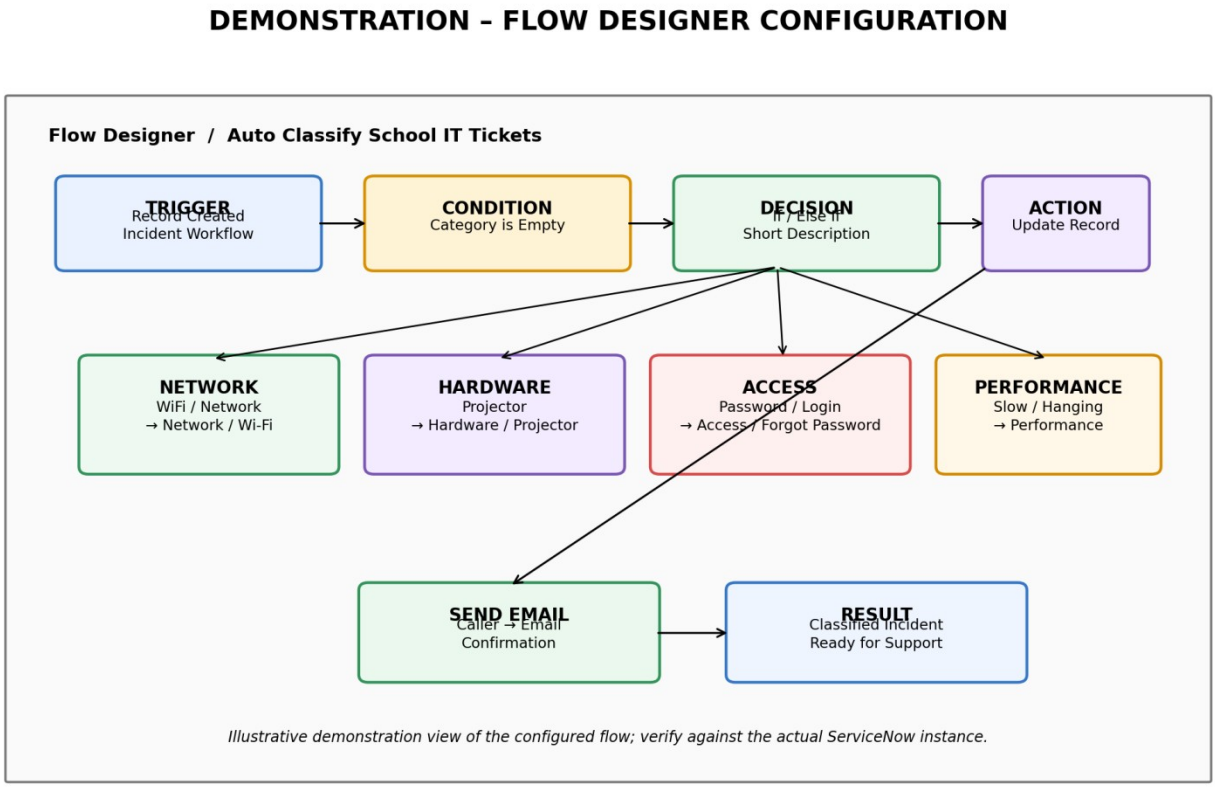

Figure 8: Flow Designer Configuration Demonstration

4. Step 3 – Create WiFi Incident

Create a new Incident Workflow record and enter the Short Description 'WiFi not working in library'. Save the record and allow the Record Created flow to execute.

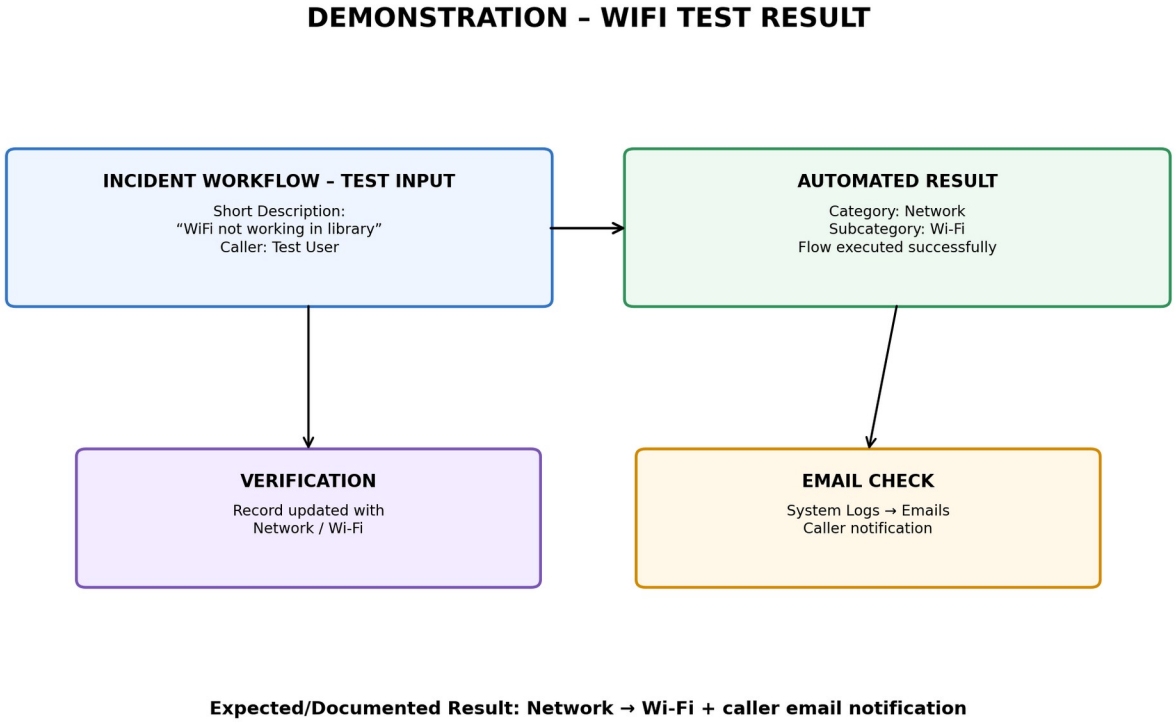

Figure 9: WiFi Test Demonstration – Network / Wi-Fi Classification

5. Step 4 – Verify WiFi Result

Verify that the ticket is classified as Category = Network and Subcategory = Wi-Fi. Then verify the caller notification in System Logs → Emails. This is one of the documented project test scenarios.

6. Step 5 – Create Projector Incident

Create another Incident Workflow record and enter the Short Description 'Projector not turning on'. Save the record and allow the flow to process the request.

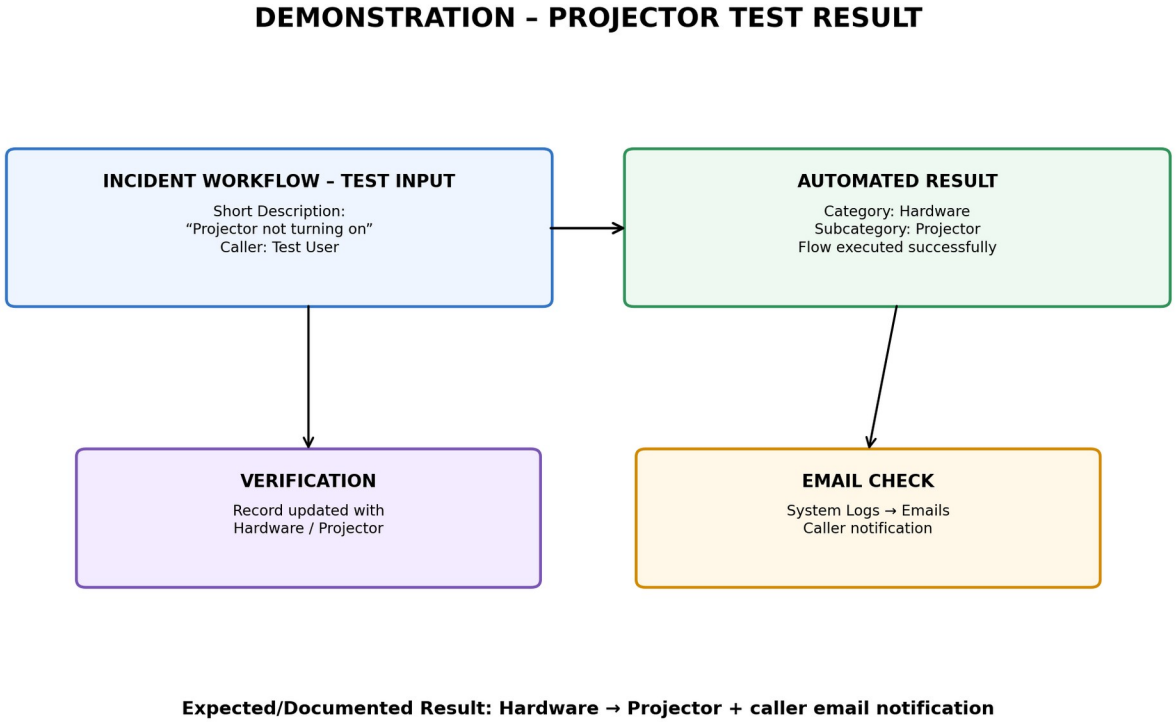

Figure 10: Projector Test Demonstration – Hardware / Projector Classification

7. Step 6 – Verify Projector Result

Verify Category = Hardware and Subcategory = Projector. Then verify the caller notification. The documented project testing identifies this scenario as a successful classification and notification case.

8. Step 7 – Show the Complete Workflow

• Show the Incident Workflow record.

• Show the Short Description used for the test.

• Show the resulting Category and Subcategory.

• Open Flow Designer and show the active automation.

• Verify the Update Record action.

• Verify the Send Email action.

• Show the email evidence when available.

• Repeat additional Password/Login and Slow/Hanging tests only when they have been executed and evidenced.

9. Mechanism of Working

The demonstration mechanism is Record Created → Category is Empty → Short Description keyword analysis → matching If/Else If branch → Update Record → Send Email. The user supplies the issue description, Flow Designer determines the classification, the incident is updated, and the caller receives confirmation.

10. Demonstration Conclusion

The demonstration provides a complete visual walkthrough of the automated ticket-classification solution. The WiFi and Projector scenarios show the documented baseline behavior. Additional configured branches should be demonstrated only after their results have been validated in the target ServiceNow instance.
