FLOW DESIGNER CONFIGURATION

DEMONSTRATION – FLOW DESIGNER CONFIGURATION

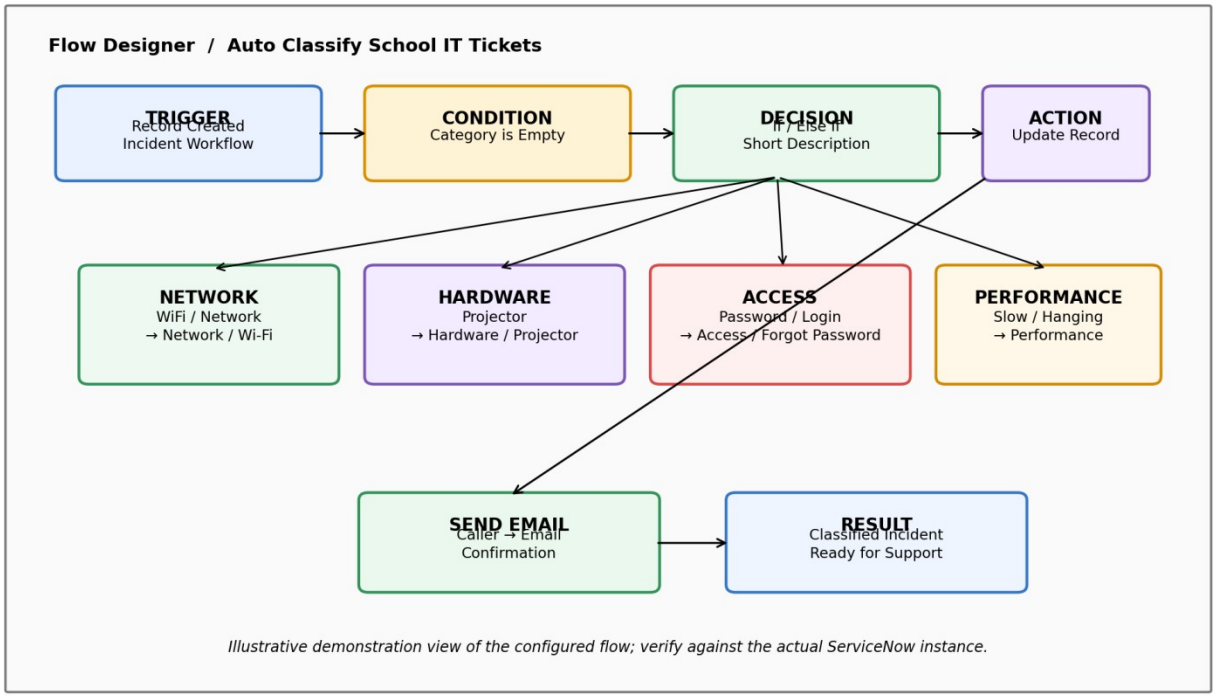

Figure 8: Flow Designer Configuration Demonstration

This demonstration view presents the Auto Classify School IT Tickets flow with its trigger, condition, decision branches, record update and email notification actions.

When a new Incident Workflow record is created and Category is empty, the flow evaluates the Short Description through If/Else If keyword conditions. The matching branch determines the Category and Subcategory, Update Record stores the classification, and Send Email provides caller confirmation.

Demonstration Verification

The image is a project-specific illustrative demonstration view prepared from the supplied project workflow and documented test scenario. For final submission, it should be replaced by or accompanied by the actual ServiceNow screenshot captured during execution if the evaluator requires original runtime evidence.
